YAAD

Your AI-Powered Archive of Digital Memories

Yaad (याद) — a Hindi word meaning “memory” or “recollection”.

Find what you need, even when you don’t remember where you stored it or exactly what to look for.

Yaad brings your digital files (.pdf, .docx, .txt, .png, .jpeg, audio, etc.) together, helping you retrieve forgotten details, connect related pieces of information across files, and piece them together into complete, context-aware, evidence-backed answers.

Have You Ever Struggled to Find Something You Know You Saved?

We save information every day across documents, PDFs, images, screenshots, and recordings. But finding it when we need it isn't always easy.

01 **Forgot where you saved it?**

You remember the information but not the filename or folder. Now you have to open multiple files just to find one detail.

02 **Remember the moment, but not the details?**

You remember visiting a place or having a conversation, but forget its name or specifics. The clues may be in your photos or recordings.

03 **Information scattered across files?**

The ticket price is in an audio recording, the venue in a poster, and the schedule in a PDF. How do you bring all the pieces together?

04 **Unsure which information is current?**

You find two versions of an announcement with different prices or deadlines. Which one should you trust?

The information already exists. Finding it, connecting it, and knowing what is still relevant shouldn't be this difficult.

Introducing YAAD

Your Personal Memory Assistant

Yaad transforms scattered digital files into a connected, searchable memory system. Ask questions naturally or provide incomplete clues to find information, connect details across files, and get answers backed by original source evidence.

How Yaad Works

1. **Multimodal Understanding**
   Extracts information from documents, PDFs, images, screenshots, and audio.
2. **Natural Language Retrieval**
   Finds information without requiring filenames, folder locations, or exact phrases.
3. **Cross-File Intelligence**
   Connects related details across files to build complete answers.
4. **Persistent, Structured Memory**
   Maintains decisions, deadlines, and commitments while tracking changes over time.
5. **Evidence-Backed Answers**
   Provides source references and supporting content so answers can be verified.

The Result

Describe what you’re looking for. Yaad finds it, connects the pieces, and shows the evidence.

Made with GAMMA

Meta AI Is the Engine Room, Not the Paint Job

Meta models understand the content. Yaad validates, organizes, and maintains the memory.

META MODELS — UNDERSTAND

- **Muse Spark 1.3:** Structured memory extraction and review using strict JSON schemas.
- **Muse Spark:** Image and PDF understanding, answer generation, and citation review.
- **Meta Voice Transcribe 1.0:** Converts audio recordings into timestamped transcripts.
- **Meta Open-Weight Models:** Local inference through the Ollama adapter.

YAAD ENGINE — VALIDATE & REMEMBER

- Validates extracted claims against original source evidence.
- Verifies relationships, detects conflicts, and manages superseded information.
- Maintains memory history and enforces retrieval and citation integrity.

WHY META MATTERS

Without Meta's model integrations, Yaad loses model-powered extraction, multimodal understanding, transcription, and answer-review capabilities, falling back primarily on keyword-based retrieval.

Guardrails: Explicit consent controls · $0.25 extraction cap · Per-call cost tracking

Made with GAMMA

System Architecture

Local-First · Meta AI-Powered · Evidence-Validated

Meta models understand. Yaad validates, remembers, and retrieves.

SYSTEM FLOW

MULTIMODAL FILE INGESTION:	Local file discovery, fingerprinting, PDF text extraction, TXT/DOCX parsing; Meta Muse Spark for PDF and image understanding; Meta Voice Transcribe 1.0 for timestamped audio transcription.
PERSISTENT STORAGE:	SQLite + FTS5 stores searchable evidence units, file metadata, structured memory, source relationships, history, and model-call audit logs.
AI-ASSISTED MEMORY FORMATION:	Muse Spark 1.3 extracts candidates; Yaad validates every candidate against original evidence; deterministic rules manage conflicts, supersession, and lifecycle.
HYBRID RETRIEVAL & ANSWER GENERATION:	FTS5 keyword search plus structured memory retrieval, fused using RRF; relevance tiers and slot checks filter candidates; Muse Spark generates or reviews answers; Yaad re-validates citations before returning an answer, conflict, or abstention.

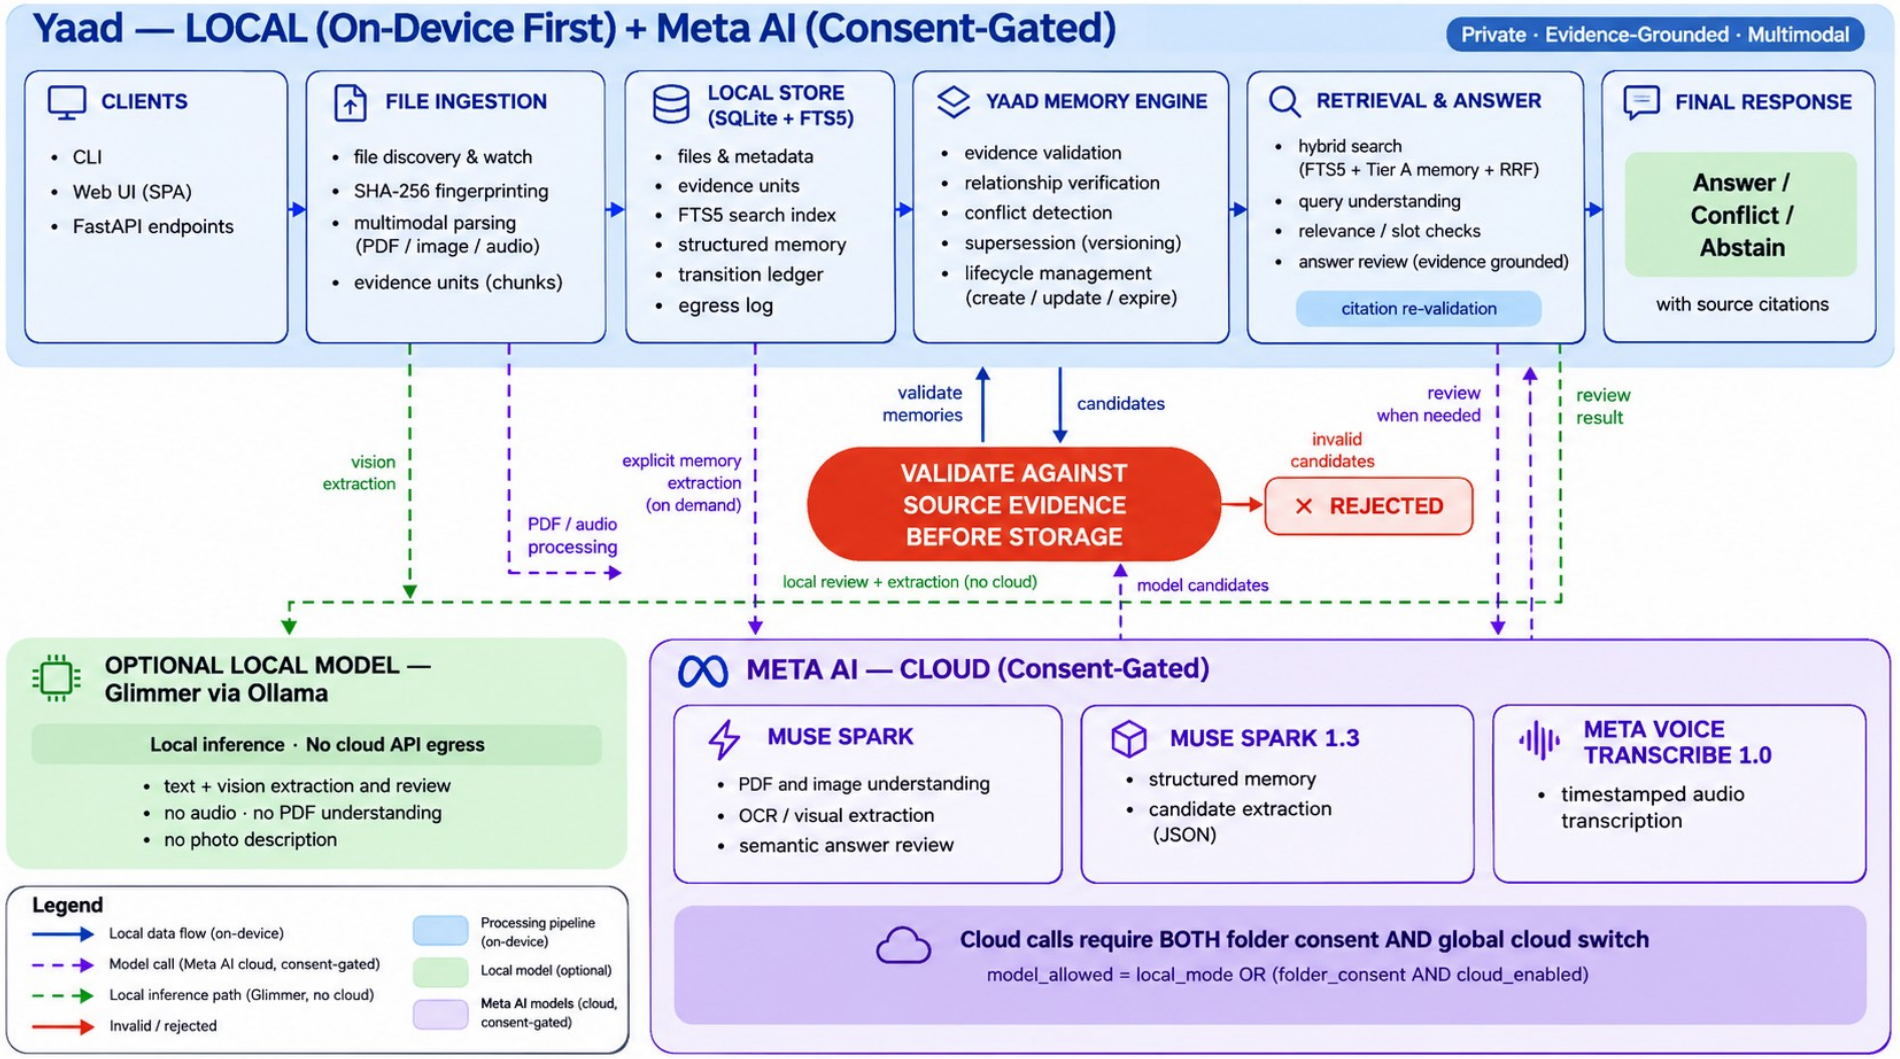

PRIVACY & TRUST

Folder-level consent + global cloud switch · Explicit memory extraction · Spend limits · Per-call egress records

Optional local inference: Meta open-weight models through the Ollama adapter.

YAAD — SYSTEM ARCHITECTURE

Made with GAMMA

Innovation: Models Propose. Evidence Disposes.

Yaad's intelligence isn't just generating answers. It's deciding what information deserves to be trusted.

01

Validation Before Storage

Every memory candidate must reference real source evidence. Unsupported candidates are rejected.

02

Verified Relationships

Conflicts and supersession are evidence-checked. Uncertain relationships remain ambiguous rather than being accepted blindly.

03

Living Memory

Identity-keyed records track decisions, deadlines, and commitments through explicit states and an append-only history ledger.

04

Precision Backstops

Tiered relevance and slot gating prevent unrelated information from influencing an answer.

05

Answer-Time Verification

Citations are checked again against retrieved evidence. Unsupported answers are downgraded or rejected.

882 passed · 18 skipped · 1 failed

Built-in safeguards narrow the hallucination surface; they do not guarantee correctness.

Made with GAMMA

From Idea to Working Product

Built from the Ground Up During the Hackathon

Yaad was conceived and developed entirely during the Meta Global AI Developer Hackathon 2026. No pre-existing project components were carried into the build.

WHAT WE BUILT

- **Multimodal File Understanding:** PDFs, documents, images, and audio recordings processed into searchable information.
- **Persistent Memory:** Structured decisions, deadlines, commitments, and questions with evidence and lifecycle tracking.
- **Natural Language Retrieval:** Ask questions using incomplete clues, without remembering filenames or exact phrases.
- **Evidence-Backed Answers:** Source references, citation validation, conflict detection, and honest abstention.
- **Privacy & Control:** Folder-level consent, cloud-processing controls, spend limits, and model-call transparency.

WORKING DEMONSTRATION

01 Add a folder containing sample files.

02 Index files and extract structured information.

03 Ask a question about information distributed across files.

04 Inspect the answer and its supporting source evidence.

05 Explore memory, history, and privacy controls.

A complete, working implementation — built during the hackathon.
